

ABSTRACT OF THE DISCLOSURE

It is an object of the invention to improve an outer appearance and the contrast of an organic EL display panel. An organic EL display panel includes a cover which has a transparency and is provided for enclosing organic EL device(s) formed on a substrate having a transparency. The display panel has transmission vision preventing means formed by providing at least colored portions in the cover. By virtue of non-luminescent areas located on the outside of the luminescent area, it is possible to prevent a poor outer appearance caused by the interior of the display panel visible from the outside of the panel.
